1 Language Switch

The declaration `\selectlanguage` switches between languages.

Τί φήμις; Ἰδὼν ἐνθ' ἔδε παῖδ' ἐλευθέρων τὰς πλησίον Νύμφας στεφανοῦσαν, Σώστροτε, ἐρῶν ἀπ' ἡλθεῖς εὐθύς;

The command `\foreignlanguage` sets its second argument in the language specified as first argument. This is intended for short text parts or single words like Βιβλιοθήκη.

Input may use literal Greek characters (α ... Ω), LICR macros (α ... Ω), or the Latin transliteration (α ... Ω) defined by the LGR font encoding (if LGR is

used).

There should be no inserted space before or after the language switch (this may happen if there are unescaped linebreaks in the font or language definitions):

Change script with `ensuregreek`: |δοῦλος|.
Change language with `\foreignlanguage`: |δοῦλος|.
Change language with `\selectlanguage`: |δοῦλος|.

2 Auto-strings

Babel defines macros for several autogenerated strings so that they may appear in the choosen language. *Babel-greek* uses LICR¹ macros in order to let the string macros work independent of the font encoding.

Περίληψη

Look for the abstract name. Today is 4 Μαρτίου 2023.

Show the auto-strings for language variant “polutoniko”.

2.1 Captions

Περίληψη, βλέπε επίσης, Παράρτημα, Βιβλιογραφία, Κοινοποίηση, Κεφάλαιο, Περιεχόμενα, Συνημμένα, Σχήμα, Γλωσσάρι, Πρός, Εύρετήριο, Κατάλογος Σχημάτων, Κατάλογος Πινάκων, Σελίδα, Μέρος, Πρόλογος, Απόδειξη, Αναφορές, βλέπε, Πίνακας

Test correct upcasing (dropping of accents):

ΠΕΡΙΛΗΨΗ, ΒΛΕΠΕ ΕΠΙΣΗΣ, ΠΑΡΑΡΤΗΜΑ, ΒΙΒΛΙΟΓΡΑΦΙΑ, ΚΟΙΝΟΠΟΙΗΣΗ, ΚΕΦΑΛΑΙΟ, ΠΕΡΙΕΧΟΜΕΝΑ, ΣΥΝΗΜΜΕΝΑ, ΣΧΗΜΑ, ΓΛΩΣΣΑΡΙ, ΠΡΟΣ, ΕΥΡΕΤΗΡΙΟ, ΚΑΤΑΛΟΓΟΣ ΣΧΗΜΑΤΩΝ, ΚΑΤΑΛΟΓΟΣ ΠΙΝΑΚΩΝ, ΣΕΛΙΔΑ, ΜΕΡΟΣ, ΠΡΟΛΟΓΟΣ, ΑΠΟΔΕΙΞΗ, ΑΝΑΦΟΡΕΣ, ΒΛΕΠΕ, ΠΙΝΑΚΑΣ

3 Hyphenation

Patterns for the Greek language variants:

monotonic: `\l@monogreek = 56`

polytonic: `\l@polygreek = 16`

ancient: `\l@ancientgreek = 4`

current: `\l@greek = 16`

Greek paragraph:

mo-no-to-nic: Ευ-ρε-τήριο, ε-πίσης, Α-πόδει-ξη

polytonic: Ε-ύρε-τήριο, ἐπίσης, Ἄ-πόδει-ξη

ancient: Ε-ύρε-τήριον, ὠσα-ύτως, Ἄ-πόδει-ξις

English paragraph with Greek text (`\foreignlanguage{greek}`):

mono-tonic: Ευ-ρε-τήριο, ε-πίσης, Α-πόδει-ξη

polytonic: Ε-ύρε-τήριο, ἐπίσης, Ἄ-πόδει-ξη

ancient: Ε-ύρε-τήριον, ὠσα-ύτως, Ἄ-πόδει-ξις

English paragraph with Greek script (`\ensuregreek`): no hyphenation

mono-tonic: Ευ-ρετήριο, επίσης, Απόδειξη

polytonic: Εύρετήριο, ἐπίσης, Ἄπόδειξη

ancient: Εύρετήριον, ὠσαύτως, Ἄπόδειξις

4 Greek Numerals (α' ... ,λ,ι,θ,λιθ')

Babel-Greek provides the macros `\greeknumeral` and `\Greeknnumeral` for the conversion of Arabic numbers from 1 to 999 999 into their Greek counterparts (α', β', γ', ..., ,λ,ι,θ,λιθ'). See `babel-greek.pdf` for the formation rules and configuration options and `test-greeknum.pdf` for samples.

Examples:

36 = λϵ' 94 = ιδ' 678 = χοη' 2002 = ββ' 923090 = ,λ,κ,γι'

36 = ΛΓ' 94 = ιΔ' 678 = ΧΟΗ' 2002 = ,ΒΒ' 923090 = ,λ,Κ,Γι'

Users can redefine the macros `\greeknumeralsix` and `\greeknumeralSix` as well as `\greeknumeralninety` `\greeknumeralNinety` to configure the used symbols.

If a font misses glyphs for the Greek numeral signs, substitute characters may be defined with the macros `\textdexiakeraia` and `\textaristerikeraia`.

Example (use “archaic kappa”, “varstigma” with `pdftex` and substitute chars for the numeral signs with `Xe/LuaTeX`):

36 = λϵ' 94 = ϑδ' 678 = χοη' 2002 = ββ' 923090 = ,λ,κ,γϑ'

36 = Λζ´ 94 = ϘΔ´ 678 = ΧΟΗ´ 2002 = ,ΒΒ´ 923090 = ,λ,Κ,ΓϘ´

The macro `\Grtoday` produces the current date with the month and the day as greek numerals. Today is Δ´ Μαρτίου ,ΒΚΓ´.

4.1 Alphabetical counters

In line with Greek typographical tradition (and to avoid messed up alphabetical counters with LGR fonts), *babel-greek* changes the internal LaTeX commands `\@alph` and `\@Alph` to use Greek numerals inside Greek text parts (see section 5.2 for an example).

5 Font Encoding

TeX’s standard 8-bit text fonts don’t provide for Greek characters. Every language switch to `greek` calls the `\extragreek` language hook which in turn calls `\greekscript` to ensure a Greek-supporting font encoding (LGR or TU). With the current setup, this document uses

- LGR as `\greekfontencoding`,
- T1 as `\latinencoding`, and T1 inside `\ensureascii`.

If `\greekfontencoding` is LGR, *babel-greek* performs additional setup steps to fix issues with the Latin transliteration (see below). If it is TU, *babel-greek* loads Greek LICR definitions from the file `tuenc-greek.def`².

Switching to a font encoding supporting the Greek script is possible without switching the Babel language using the declarations `\greekscript` (no switch if the current encoding supports the Greek script (e.g. the Unicode font encodings TU and PU) or `\greetext` (always switch to LGR) and the corresponding functions `\ensuregreek` and `\lgrfont`.³ These commands also work in the middle of a paragraph or word: Φίλων τοῦ TeX (ΕΦΤ) – Friends (Φίλων) of TeX.

5.1 LGR’s *Latin transliteration*

LGR has Greek characters in the slots reserved for Latin characters and other symbols in a TeX *standard text font encoding*. This allows the use of a *Latin transliteration* for the input of Greek characters⁴, however, characters that should be printed as Latin characters must be protected from conversion by a font encoding switch, either selecting a different language or wrapping them with `\ensureascii` (provided by the Babel core), that sets its argument using an ASCII-compatible font encoding. The legacy declaration `\latintext` switches the font encoding to `\latinencoding`.

With the Unicode font encoding TU, Latin characters can be used in Greek text parts and the Latin transliteration does not work (but see the last example below).

²Provided by *greek-fontenc* since version 0.14 (2020-02-28)

³Hyphenation patterns are not changed, check for wrong hyphenations.

⁴see `usage.pdf`

The following quote (with the Babel language set to Greek) illustrates the problem:

Literal characters, words in the “foreign” script protected:

Φίλων τοῦ TeX (EΦT) – Friends (Φίλων) of TeX.

Unprotected ASCII characters come out as Greek characters with LGR:

Φίλων τοῦ TεΞ (EΦT) – Φριενδς (Φίλων) οφ TεΞ.

The Latin transliteration works in LGR but not TU:

Φίλων τοῦ TeX (EΦT) – Friends (Φίλων) of TeX.

The Latin transliteration can be used with also with Xe/LuaTeX, if the input text is wrapped in `\lgrfont`⁵ but may result in non-matching fonts and wrong hyphenation:

Φίλων τοῦ TeX (EΦT) – Friends (Φίλων) of TeX.

5.1.1 LGR-proofed macros

Babel-greek provides LGR-local variants for some *TextCommands* that rely on a standard text encoding.⁶ The fallback definitions for some *textcomp* symbols compose the symbols out of Latin letters. The fixes must not overwrite the selection of pre-composed symbols from *textcomp* or TU (try copy and paste from the PDF output).

LGR fonts have a middle dot glyph at the place of the ampersand. The new *TextCommand* `\textampersand` always prints an ampersand.

English: (T1) ©[®]™ A&W
English: (ΛΓP) ©[®]™ A&Ω
Greek: (ΛΓP) ©[®]™ A&Ω

5.2 LGR re-definitions

The generic macro `\&` is re-defined inside Greek text parts to use the original definition in math mode and `\textampersand` in text mode.

5.2.1 Roman numerals

Without fixes, Roman numerals are printed according to the Latin transliteration (including the conversion of “v” to a ZERO WIDTH NON-JOINER) if the font encoding is LGR:

T1: i, ii, iii, iv, . . . , mcmlxxv
ΛΓP: ι, υ, ιι, ιιι, . . . , μςμλξξ

Roman numerals are used by the default document classes, e.g., in the third level of enumerations or as page numbers in the frontmatter of a book. They

⁵available, if the LGR encoding is loaded with the *fontenc* package

⁶These workarounds cannot be done in `lgrenc.def` from the *greek-fontenc* package because they are not allowed in a “font encoding definition file” [`fntguide.pdf`].

may move to auto-generated document parts like the ToC, (hyper)references, or an index.

As document authors cannot wrap page numbers in a ToC in `\ensureascii`, *Babel-greek* redefines the internal LaTeX commands `\@roman` and `\@Roman` to make Roman numerals LGR-proof. Unfortunately, this breaks Makeindex (cf. `test-lgr-fixes.tex`).

5.2.2 Example

In Greek text parts, enumerated lists use Greek numerals in the second and fourth level and ASCII-proofed Roman numerals in the third level.

1. τεμ 1
 - (α) τεμ 1.1
 - i. τεμ 1.1.1
 - A'. τεμ 1.1.1.1
 - B'. τεμ 1.1.1.2
 - Γ'. τεμ 1.1.1.3
 - ii. τεμ 1.1.2

Setting the language back to English should restore the alphabetic numbering:

1. item 1
 - (a) item 1.1
 - i. item 1.1.1
 - A. item 1.1.1.1
 - B. item 1.1.1.2
 - C. item 1.1.1.3
 - ii. item 1.1.2

More test of the LGR-redefinitions are in `test-lgr-fixes.tex`.

6 Up- and downcasing in Greek

Capital Greek letters have diacritics (except the dialytika and sub-iota) to the left (instead of above) and drop them in uppercase (except the dialytika), e.g., $\mu\acute{\alpha}\sigma\tau\rho\omicron\varsigma \mapsto \text{M}\acute{\text{A}}\acute{\text{I}}\text{S}\text{T}\rho\text{O}\Sigma$. For literal Greek characters and accent macros, these rules are implemented and tested in the required package *[greek-fontenc](#)*.

Tonos and dasia mark a *hiatus* (break-up of a diphthong) if placed on the first vowel of a diphthong. A dialytika must be placed on the second vowel if they are dropped, e.g. $\acute{\alpha}\iota, \acute{\alpha}\upsilon, \acute{\epsilon}\iota, \acute{\alpha}\iota, \acute{\alpha}\upsilon, \acute{\alpha}\upsilon, \acute{\epsilon}\iota \mapsto \text{A}\acute{\text{I}}, \text{A}\acute{\text{Y}}, \text{E}\acute{\text{I}}, \text{A}\acute{\text{I}}, \text{A}\acute{\text{Y}}, \text{A}\acute{\text{Y}}, \text{E}\acute{\text{I}}$.

Some affected words:

$\acute{\alpha}\lambda\omicron\varsigma \mapsto A\check{\Upsilon}\Lambda\omicron\Sigma$, $\check{\alpha}\lambda\omicron\varsigma \mapsto A\check{\Upsilon}\Lambda\omicron\Sigma$,
 $\acute{\mu}\acute{\alpha}\iota\nu\alpha \mapsto MA\check{\I}\check{N}A$,
 $\acute{\kappa}\acute{\epsilon}\iota\kappa \mapsto KE\check{\I}\check{K}$,
 $\acute{\alpha}\upsilon\pi\nu\acute{\iota}\alpha \mapsto A\check{\Upsilon}\Pi\check{N}\check{I}A$,
 $\rho\omega\acute{\mu}\acute{\epsilon}\iota\kappa\alpha \mapsto P\Omega ME\check{\I}\check{K}A$.

With the pre-2022/06 `\MakeUppercase`, automatic upcasing of words with *hiatus* works correctly only if the accents are input as macro and the letters as macro or via the Latin transliteration.

With the current (2023/02/10) `\MakeUppercase`, it works for literal Unicode input and named accents. The definitions in `*enc.def` files, `uccodes` and the `@uclclist` are ignored.

6.1 Changed `uccode/lccode` values for LGR

LGR encoded fonts define ligatures for characters with diacritics. To enable correct upcasing, *babel-greek* changes the `uc/lccodes` of some characters. Characters used to input diacritics are mapped to the “empty” character `0x9f = 159`.

To minimise side-effects (see below), `uc/lccodes` are only changed:

- if `\greekfontencoding` is a “short macro” expanding to LGR,⁷
- if the LaTeX version is older than 2022/06, as `uccodes` are ignored by the `\MakeUppercase` implementation introduced in this version
- for accents that are actually required in the selected language variant (i.e. only for the *tonos*, if the language variant is the default “monotonic”).

With `\greekfontencoding LGR`, LaTeX version 2020-10-01, and language variant “*polutoniko*” we get for *dialytika*⁸, *sub-iota*, *tonos/oxia*, *varia*, *psili*, and *dasia*:

$\acute{\iota}, \acute{\iota}^{\cdot}, \acute{\iota}^{\cdot\cdot} \mapsto \acute{\iota}, \acute{\iota}^{\cdot}, \acute{\iota}^{\cdot\cdot}$

Composite command definitions ensure that combined accents also work for accent characters “upcased” to the character No 159 = `0x9f`):

$\acute{\iota} \acute{\iota} \acute{\iota} \acute{\iota} \acute{\alpha} \acute{\alpha} \acute{\alpha}\iota \acute{\alpha}\iota \mapsto \check{\Upsilon} \check{\Upsilon} \check{\Upsilon} \check{\Upsilon} A A A\check{\I} A\check{\I}$

With *babel-greek* versions up to 1.11, using the tilde for the *perispomeni* accent inside `\MakeUppercase` led to a

Package inputenc Error: Invalid UTF-8 byte "9F

(even without loading *inputenc* and with `\UseRawInputEncoding`).⁹ Version 1.12 fixes the issue so that all three input variants work again (with LaTeX versions up to 2022/06)¹⁰

⁷i.e. not in documents using Unicode fonts unless `\greekfontencoding` is explicitly set to LGR before loading *babel-greek*

⁸Unless followed by a to-be accented vowel, the quotation mark " is converted to an upper right apostrophe by LGR.

⁹cf. [LaTeX News 28](#)

¹⁰There are new issues with the implementation of `\MakeUppercase` introduced in the 2022/06 LaTeX release, cf. [LaTeX News 35](#)

ũ ũ ũ ↦ Υ Υ Υ

The changed uc/lccodes have strange effects on Latin text parts in Greek paragraphs if only the encoding is switched:

English: Let's see: " | ' ' > < ↦ LET'S SEE: " | ' ' > <

`\ensureascii`: Let's see: " | ' ' > < ↦ LET§§ SEE: " | § § § §

To limit the effect on, e.g., section headings (which are printed capitalised with the “headings” style), `uccodes` for “v” (zero-width space) and “c” (final sigma) are not changed. Use `\textcompwordmark` instead of `v` and autosigma (`s`) instead of `c` in text parts that could/should become upcased, e.g., $\alpha\upsilon\varsigma$ ↦ $AΥΣ$ not $\alpha\upsilon\varsigma$ ↦ $A\Upsilon^{\wedge}$.
